• Write a class named `MyHex` with the following methods:
  o Write a method named `convertHexToDecimal` that parses a hex number as a string into a decimal value.

    For example, hexString “A5” is 165(10*16+5=165) and “FAA” is 4129(15*16^2 +10*16+10 =4129)

  o Write a method named `convertDecimalToHex` that parses a decimal number into a hex.

• Write another class to test your `MyHex` class. Use `MyHex.convertHexToDecimal(“ABC7DE”)` to test the program. (Answer is 11257822)
